The Bean Allele Frequency Lab

Purpose: The following pictures are a guide to show one example of how the allele frequency could change in a population due to a genetic disorder.

Setup: The three types of beans (red [RR], pinto [Rr] and white [rr]) will be used to represent a population of individuals with a certain trait.

~~The Bean Lab: Allele Frequency~~

There are a total of 100 beans in your bag (50 Black Beans = non-renewable and 50 White Beans = renewable).

Have one student (can't be the same person as in part I) blindfold themselves and then pull out 10 beans. Count the number of black and

beans in a relative mass. These values are the same.

~~Laboratory Activity 1: Teacher Notes Continued~~

Answers to Discussion Questions
(Student answers will vary.) 1. The atomic mass of the "bean bag" element (Bg) represents a weighted average of the mass of each isotope and its relative abundance. Use the following equation to calculate the atomic mass of Bg. Note: Divide the percent abundance of each isotope by 100 to obtain its relative abundance.

I counted 340 white beans. They have a mass of 80 grams. The average mass of one white bean is $80 / 340 = 0.235$ grams. Find the isotopic abundance (% of beans) for each isotope by dividing the number of atoms of one isotope by the total number of atoms (black, brown, plus white) and multiplying by 100%. Record on the data table to the nearest 0.1%.
