Blood Will Tell reveals the underlying centrality of "blood" that shaped official ideas about who was eligible to be defined as Indian by the General Allotment Act in the United States. Katherine Ellinghaus traces the idea of blood quantum and how the concept came to dominate Native identity and national status between 1887 and 1934 and how related exclusionary policies functioned to dispossess Native people of their land. The U.S. government's unspoken assumption at the time was that Natives of mixed descent were undeserving of tribal status and benefits, notwithstanding that Native Americans of mixed descent played crucial roles in the national implementation of allotment policy. Ellinghaus explores on-the-ground case studies of Anishinaabeg, Arapahos, Cherokees, Eastern Cherokees, Cheyennes, Chickasaws, Choctaws, Creeks, Lakotas, Lumbees, Ojibwes, Seminoles, and Virginia tribes. Documented in these cases, the history of blood quantum as a policy reveals assimilation's implications and legacy. The role of blood quantum is integral to understanding how Native Americans came to be one of the most disadvantaged groups in the United States, and it remains a significant part of present-day debates about Indian identity and tribal membership. Blood Will Tell is an important and timely contribution to current political and scholarly debates.

This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or PO₂ on the cell surface falls to a critical level of about 4–5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO₂. In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.

The local community around the Nat Turner rebellion The 1831 Southampton Rebellion led by Nat Turner involved an entire community. Vanessa M. Holden rediscovers the women and children, free and enslaved, who lived in Southampton County before, during, and after the revolt. Mapping the region's multilayered human geography, Holden draws a fuller picture of the inhabitants, revealing not only their interactions with physical locations but also their social relationships in space and time. Her analysis recasts the Southampton Rebellion as one event that reveals the continuum of practices that sustained resistance and survival among local Black people. Holden follows how African Americans continued those practices through the rebellion's immediate aftermath and into the future, showing how Black women and communities raised children who remembered and heeded the lessons absorbed during the calamitous events of 1831. A bold challenge to traditional accounts, *Surviving Southampton* sheds new light on the places and people surrounding America's most famous rebellion against slavery.

This e-book will review special features of the cerebral circulation and how they contribute to the physiology of the brain. It describes structural and functional properties of the cerebral circulation that are unique to the brain, an organ with high metabolic demands and the need for tight water and ion homeostasis. Autoregulation is pronounced in the brain, with myogenic, metabolic and neurogenic mechanisms contributing to maintain relatively constant blood flow during both increases and decreases in pressure. In addition, unlike peripheral organs where the majority of vascular resistance resides in small arteries and arterioles, large extracranial and intracranial arteries contribute significantly to vascular resistance in the brain. The prominent role of large arteries in cerebrovascular resistance helps maintain blood flow and protect downstream vessels during changes in perfusion pressure. The cerebral endothelium is also unique in that its barrier properties are in some way more like epithelium than endothelium in the periphery. The cerebral endothelium, known as the blood-brain barrier, has specialized tight junctions that do not allow ions to pass freely and has very low hydraulic conductivity and transcellular transport. This special configuration modifies Starling's forces in the brain microcirculation such that ions retained in the vascular lumen oppose water movement due to hydrostatic pressure. Tight water regulation is necessary in the brain because it has limited capacity for expansion within the skull. Increased intracranial pressure due to vasogenic edema can cause severe neurologic complications and death.

Steven Shapin argues that science, for all its immense authority and power, is and always has been a human endeavor, subject to human capacities and limits. Put simply, science has never been pure. To be human is to err, and we understand science better when we recognize it as the laborious achievement of fallible, imperfect, and historically situated human beings. Shapin's essays collected here include reflections on the historical relationships between science and common sense, between science and modernity, and between science and the moral order. They explore the relevance of physical and social settings in the making of scientific knowledge, the methods appropriate to understanding science historically, dietetics as a compelling site for historical inquiry, the identity of those who have made scientific knowledge, and the means by which science has acquired credibility and authority. This wide-ranging and intensely interdisciplinary collection by one of the most distinguished historians and sociologists of science represents some of the leading edges of change in the scholarly understanding of science over the past several decades.

This report from the Committee on Military Nutrition Research reviews the history of caffeine usage, the metabolism of caffeine, and its physiological effects. The effects of caffeine on physical performance, cognitive function and alertness, and alleviation of sleep deprivation impairments are discussed in light of recent scientific literature. The impact of caffeine consumption on various aspects of health, including cardiovascular disease, reproduction, bone mineral density, and fluid homeostasis are reviewed. The behavioral effects of caffeine are also discussed, including the effect of caffeine on reaction to stress, withdrawal effects, and detrimental effects of high intakes. The amounts of caffeine found to enhance vigilance and reaction time consistently are reviewed and recommendations are made with respect to amounts of caffeine appropriate for maintaining alertness of military personnel during field operations. Recommendations are also provided on the need for appropriate labeling of caffeine-containing supplements, and education of military personnel on the use of these supplements. A brief review of some alternatives to caffeine is also provided.
